

Prism — Demo Script (1–3 minutes)

Record this exact flow. It deliberately hits the evaluation beats: numeric exactness, domain switch, clarification, and multi-format render from one canonical answer.

Setup before recording

1. Ollama running; generation model loaded (qwen2.5:7b-instruct or the winner from docs/decisions.md §3).
2. API: `uv run uvicorn prism.api.main:app --port 8000`
3. UI: `cd web; npm run dev` → `http://localhost:5173`
4. New conversation. Full screen. Hide personal desktop clutter.

Script (~2:00)

0:00–0:15 — Hook

Voiceover: “Prism is one local agent across five Kohler enterprise domains — HR, Finance, Customer Support, Privacy, and Legal — with answers you can reformat on demand.”

Show the empty state with domain chips.

0:15–0:40 — Finance exactness

Ask: An employee submits an expense claim for █15,000. Who needs to approve it?

Expect: Reporting Manager (band █5,001–█25,000), high confidence, Finance domain chip.

Voiceover: “Hard numeric thresholds — the agent has to get the band exactly right.”

0:40–1:05 — Domain switch (no restating context)

Ask: My toilet is occasionally leaking or running — what should I check?

Expect: domain chip flips to Customer Support; steps about trip lever / flapper / canister.

Voiceover: “Mid-conversation domain switch — retrieval re-routes without a new session.”

1:05–1:25 — Anaphora follow-up

Ask: What about that flapper seal you mentioned?

Expect: grounded follow-up using prior context.

1:25–1:45 — Clarification moment

New chat (or a deliberately ambiguous ask): what's the policy on returns and leave?

Expect: clarification question with HR vs Customer Support (or similar) — answer the chip.

Voiceover: “When routing is ambiguous, Prism asks — it doesn't guess.”

1:45–2:10 — One answer, five formats

Back on a solid Finance or Support answer. Click format bar: **JSON** → **XML** → **Excel download** → **Email**.

Voiceover: “Same canonical answer object — no re-retrieval, no re-prompting.”

2:10–2:20 — Close

“Runs fully local on Ollama within 8GB VRAM. Prism — one query, any format.”

Checklist while editing

- [] Show session title auto-updating after first turn
- [] Show sources under an assistant bubble
- [] Show Excel actually downloading
- [] No long silent waits — cut dead air while the model thinks
- [] Caption: “Academic case study · synthetic HR/Finance · real Kohler Support/Privacy/Legal”

Upload

Upload to YouTube/Drive unlisted; put the link in README under **Demo video**.
